                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present DNA sequence encodes Thermus sp. replication protein, RepT CC which is obtained from pTsp45S plasmid The replication protein, RepT is needed for thermophilic plasmid replication.

CC needed for thermophilic plasmid protein protein RepT, partition the invention relates to Thermus sp. replication protein RepT, partition protein ParA and their corresponding DNA molecules which relates to recombinant DNA molecules encoding plasmid DNA replication origins in Thermus, as well as to shuttle vectors which contain the same The green which comprises inserting plasmid DNA comprising a Thermus sp. plasmid genes which comprises inserting plasmid DNA comprising a Thermus sp. plasmid of replication (Ori) into a recombinant plasmid comprising a thermostable kanamycin-resistance gene and an Escherichia coli Ori, to produce a cloned recombinant plasmid. This cloned recombinant plasmid is transformed with an E. coli host cell, and E. coli host cell cultured for the expression of cloned recombinant plasmid. The cloned recombinant plasmid isolated from E. coli host cell, so then transformed with Thermus sp. plasmid genes are cloned. These plasmid DNAs are used for thermostable transformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The open reading frame of pTsp45S plasmid is the replication protein, RepT which is neede for thermophilic plasmid replication.

The invention relates to Thermus sp. replication protein RepT, partition protein ParA and their corresponding DNA molecules which relates to recombinant DNA molecules encoding plasmid DNA replication origins in Thermus, as well as to shuttle vectors which contain the same. The invention also relates to method useful for cloning Thermus sp. plasmid genes which comprises inserting plasmid DNA comprising a Thermus sp. origin of replication (Ori) into a recombinant plasmid comprising a thermostable kanamycin-resistance gene and an Escherichia coli Ori, to reproduce a cloned recombinant plasmid to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4157
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               produce a cloned recombinant plasmid. This cloned recombinant plasmid is transformed with an E. coli host cell, and E. coli host cell cultured for the expression of cloned recombinant plasmid. The cloned recombinant plasmid isolated from E. coli host cell is then transformed with Thermus sp. host cell and Thermus sp. host cell and Thermus sp. plasmid genes are cloned. These plasmid DNAs are used for thermophilic transformation.

                                           The sequence shown is that isolated from Thermus aquaticus genomic DNA and encodes a heat resistant super oxide dismutase enzyme. The gene is useful for medicines for inflammation and as a protection against X-rays, as a reagent for research in enzyme electrodes or an enzyme for a bioreactor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by growing transformant weed for several years and then removing an inducible promoter. The present cDNA sequence encodes revertion

                                                                                                                                                    This sequence represents a Herpes simplex virus type-2 (HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2546), is designated Contig ID 10, and encodes B HSV-2 proteins. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological response in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 1998-286847/25.

The invention relates to a composition comprising an expression vector cobound to an aggregated protein-polycationic polymer conjugate or suspension. The expression vector contains a promoter polynucleotide cathigen which is a fragment of a gene or genome associated with an comprising of bacterium, fungus, protozoa and virus such as human consisting of bacterium, fungus, protozoa and virus such as human consisting of bacterium, fungus, protozoa and virus such as human consisting of bacterium, fungus, protozoa and virus such as human consisting of bacterium, fungus, protozoa and virus (HSV), hepatitis consisting of bacterium, fungus, protozoa and virus (HSV), hepatitis consisting of bacterium, fungus, protozoa and virus (HSV), and consisting a nucleotide sequence encoding a cytokine (or a cytokine expression vector), is useful for inducing an immune response contains a sequence for granulocyte macrophage-colony stimulating factor (GM-CSF) or interleukin-12 (IL-12). The polynucleotide sequences encoding the antigen and the cytokine are under transcriptional control of same or contains a sequence is useful for treating a condition in an organism. The correspondence is human herpesvirus 2 complete DNA genome related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 90-132; 145pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to CC generate fusion proteins by linking to the gene to a human immunoglobulin CC Fc portion (e.g. AAV34277) for increasing the stability of the fused CC protein as compared to the human protein only.

CC rate invention relates to 28 novel genes and their fragments (nucleic CC acid sequences: AAV34286-V34325; amino acid sequences AAW75196-W75235) CC which are useful for preventing, treating or ameliorating medical CC conditions e.g. by protein or gene therapy. Also, pathological CC conditions can be diagnosed by determining the amount of the new polynucleotides. Specific uses are described for each of the 28 CC polypeptides in a sample or by determining the presence of mutations in CC conditions, based on which tissues they are most highly expressed in CC (see AAV34286 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                      The sequence is that of the coding region of the groEL-1 gene which codes for the 18 kDa heat shock protein HSP18. The gene actually codes for a 56 kDa protein but this is subjected to post translation modifification to give the 18 kDa HSP18 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of the complete groEL-1 gene which codes for the 18 kDa heat shock protein HSP18. The gene actually codes for a 56 kDa protein but this is subjected to post translation modififcation to give the 18 kDa HSP18 protein. See also AAQ22477-Q22486.

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CC pseudoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets of or antibiotic development. The antisense nucleic acids can also be used CC identify proteins used in proliferation, to express these proteins. CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in CC a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.
CC Note: The sequence data for this patent did not form part CC format directly from WIPO at CC format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a Herpes simplex virus type-2 (HSV-2) DNA sequence of the invention. This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2546), is designated Contig ID 104, and encodes 17 HSV-2 proteins. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological response in a mammal.

This invention describes novel DNA sequences encoding for polyketide C (PK)-like synthesis (PKS-like) pathway genes from Shewanella, Vibrio cand Schizochtrium. The nucleic acids are useful for isolating related CC molecules or in methods to detect organisms expressing the PKS-like CC genes. They are also useful for creating transgenic plants that express C poly-unsaturated long chain fatty acids. The poly-unsaturated long chain fatty acids produced recombinantly are useful as dietary supplements for CC patients undergoing intravenous feeding or for preventing or treating CC malnutrition. The poly-unsaturated long chain fatty acids can also be incorporated into cooking oils, fats or margarine formulated so that in CC normal use the recipient receives a desired amount of poly-unsaturated CC production of the fatty acids and edicated and elcosapentenoic acid, and for the CC modification of the fatty acid profile of host cells and edible plant CC tissues and/or plant parts. Transgenic production of polyunsaturated CC faity acids in particular host cells allows quicker purification from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PKS pathway; polyunsaturated long chain fatty acid; plant; transgenic; polyketide-like synthesis; PUFA; dietary supplement; intravenous feedi malnutrition; cooking oil; cooking fat; margarine; docosahexenoic acid production; elcosapentenoic acid production; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA sequences encoding for polyketide (PK)-like synthesis pathway genes from Shewanella, Vibrio and Schizochtrium, useful for creating transgenic plants that express poly-unsaturated long chain fatty acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 6; Fig 27C1-2; 302pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           797
Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   aggccagggaaagccaggctcaccctggacgactacatctacccctggaggaacctcgcc 621

/note="Vector: pBluescript SK(-); State University,
Pullman, WA in a greenhouse, the rachises were excised and
frozen in liquid nitrogen (Kleinhofs lab). In the TJ Close
lab at the University of California, Riverside total RNA
was prepared, poly(A) was purified, one primary
unamplified cDNA library was made, and 1 million pfu were
in vivo excised to give pBluescript SK(-) cDNA phagemids
(Chin). Phagemids were plated and picked at the Clemson
University Genomics Institute (CUGI) (Begum, Palmer,
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Rambo, Main). The
sequence has been trimmed to remove vector sequence and
contains a minimum of 100 bases of phred value 20 or
above. For more details on library preparation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   þ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (<http://depts.washington.edu/ventures/collabtr/direct/index.htm>#b
rt). Overall sequence quality assessment and vector trimming were
conducted using the Lucy software (<http://www.tigr.org/softlab/>).
Lucy parameters were set to ensure an overall trimmed quality of
97.5% or better without any vector fragments in the chosen
high-quality region of each sequence. Low-quality bases between the
poly-T and the high-quality region were replaced with N's to serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Unpublished (2001)

Five-day old seedling roots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 1 million pfu were in vivo exclsed to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of thread walls 20 crashes a minimum of 100 bases of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the sequence and contains a minimum of the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contain

//note="Organ: juvenile vegetative shoots; Vector:
pAD-GAL4-2.1; Site_1: EcoR1; Site_2: XhoI; Equal amounts
of total RNA by weight from 4 tissue sources (see below)
were pooled, polyA+ RNA isolated, and cDNA synthesized for
EcoRI (5') and XhoI (3') directional cloning into lambda
Hybrizap vector from Stratagene. Tissue Sources: 1. Whole
shoots 3 days after sowing/imbibing in wet soil. 2. Basal
1.5 cm shoots 6 days after sowing includes yellow
portions of developing leaves 1-5, primordia from 6-8, and
the vegetative apex. 3. Non-green portions of developing
leaves 4-5 and the vegetative apex, including adult leaf
primordia, 9 days after sowing. 4. Partially expanded and
greening leaves 4-5 at 13 days after sowing."

Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<a href="http://www.tigr.org/softlab/">http://www.tigr.org/softlab/</a>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Unpublished (2001)

                  resulting DNA:RNA hybrid was treated with RNase H and used as a template for DNA PolI-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the ds-cDNAs were digested with NotI and size-selected. The resulting molecules were directionally cloned into the EcoRI and NotI sites of the pT7T3PAC vector. The library then went through one round of normalization to CoT value of 5 based on the methods of Marcelo Bento Soares (Genome Research 6: 791-806, 1996)."

Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<a href="http://www.tigr.org/softlab/">http://www.tigr.org/softlab/</a>). Lucy parameters were set to enact of the moveral trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (23-JUL-1999) Genoscope - Centre National de Sequencage BP 191 91006 EVRY cedex - FRANCE (E-mail : seqrefégenoscope.cns.fi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2: /note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2: XhoI; plants were grown at Washington State University, Pullman, WA in a greenhouse, the rachises were excised and frozen in liquid nitrogen (Kleinhofs lab). In the TJ Close lab at the University of California, Riverside total RNA was prepared, poly(A) was purified, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above.
